Apply filters to SQL queries

Project description

My organization is working to make their system more secure. It is my job to ensure the system is safe, investigate all potential security issues, and update employee computers as needed. The following steps provide examples of how I used SQL with filters to perform these different security-related tasks.

Retrieve after hours failed login attempts

There was a potential security incident that occurred after business hours (after 18:00). All after hours login attempts that were unsuccessful needed to be investigated.

The following code demonstrates how I created a SQL query to filter for unsuccessful login attempts that occurred after business hours.

```
MariaDB [organization]> SELECT *
    -> FROM log_in_attempts
    -> WHERE login_time > '18:00' AND success = 0
    -> ;
+----------+----------+------------+------------+---------+-----------------+---------+
| event_id | username | login_date | login_time | country | ip_address      | success |
+----------+----------+------------+------------+---------+-----------------+---------+

+----------+----------+------------+------------+---------+-----------------+---------+
19 rows in set (0.020 sec)
```

The first four lines of commands on the screenshot is my query, and the second part is the output I received. This query filters for failed login attempts that occurred after 18:00. First, I

started by selecting all data from the `log_in_attempts` data table. Then, I used a `WHERE` clause with an `AND` operator to filter my results to output only login attempts that occurred after 18:00 and were unsuccessful. The first condition is `login_time > '18:00'`, which filters for the login attempts that occurred after 18:00. The second condition is `success = 0`, which filters for the failed login attempts.

Retrieve login attempts on specific dates

The organization experienced a suspicious event on 2022-05-09 in order to investigate this event any login activity that happened on 2022-05-09 or the day before needed to be investigated. The following code demonstrates how I created a SQL query to filter and review all login attempts that occurred specifically on the dates 2022-05-09, 2022-05-08.

```
MariaDB [organization]> SELECT *
    -> FROM log_in_attempts
    -> WHERE login_date = '2022-05-09' OR login_date = '2022-05-08' ;
+----------+----------+------------+------------+---------+-----------------+---------+
| event_id | username | login_date | login_time | country | ip_address      | success |
+----------+----------+------------+------------+---------+-----------------+---------+

```

The first three lines of code on the screenshot is my query, and the rest is a portion of the output I received with my specific filters. This query returns all login attempts that occurred on 2022-05-09 or 2022-05-08. First, I started by selecting all data from the `log_in_attempts` table. Then, I used a `WHERE` clause with an `OR` operator to filter my results to output only login attempts that occurred on either 2022-05-09 or 2022-05-08. The first condition is `login_date = '2022-05-09'`, which filters for logins on 2022-05-09. The second condition is `login_date = '2022-05-08'`, which filters for logins on 2022-05-08.

Retrieve login attempts outside of Mexico

After investigating the organization's data on login attempts, I believe there is an issue with the login attempts originating outside of Mexico. These login attempts should be investigated.

The following code demonstrates how I created a SQL query to filter for login attempts that originated outside of Mexico.

```
MariaDB [organization]> SELECT *
    -> FROM log_in_attempts
    -> WHERE NOT country LIKE 'MEX%' ;
+----------+----------+------------+------------+---------+----------------+---------+
| event_id | username | login_date | login_time | country | ip_address     | success |
+----------+----------+------------+------------+---------+----------------+---------+

|       18 | pwashing | 2022-05-11 | 19:28:50   | US      | 192.168.66.142  |       0 |
```

The first three commands of the screenshot are the parameters for my query, and the rest of the screenshot is a portion of the output I received. This query returns all login attempts that occurred in countries other than Mexico. First, I started by selecting all data from the `log_in_attempts` data table. Then, I used a `WHERE` clause with a `NOT` to filter for countries other than Mexico. I used `LIKE` with `'MEX%'` as the pattern to match because the dataset displays Mexico as `MEX` and `MEXICO`. The percentage sign (`%`) represents any number of unspecified characters when used with `LIKE`.

Retrieve employees in Marketing

My team wants to perform security updates on specific employee machines in the marketing department. They only want to perform the security updates on employees specifically in our east offices.

The following SQL commands are what I used to create a query so my team would know whose machines we needed to update.

```
MariaDB [organization]> SELECT *
    -> FROM employees
    -> WHERE department = 'marketing' AND office LIKE 'East%' ;
+-------------+--------------+----------+------------+----------+
| employee_id | device_id    | username | department | office   |
+-------------+--------------+----------+------------+----------+
|        1000 | a320b137c219 | elarson  | Marketing  | East-170 |
|        1052 | a192b174c940 | jdarosa  | Marketing  | East-195 |
|        1075 | x573y883z772 | fbautist | Marketing  | East-267 |
|        1088 | k8651965m233 | rgosh    | Marketing  | East-157 |
|        1103 | NULL         | randerss | Marketing  | East-460 |
|        1156 | a184b775c707 | dellery  | Marketing  | East-417 |
|        1163 | h679i515j339 | cwilliam | Marketing  | East-216 |
+-------------+--------------+----------+------------+----------+
7 rows in set (0.001 sec)
```

The first three commands of the screenshot are my query parameters, and the rest of the screenshot is a portion of the output I received. This query returns all employees in the Marketing department in the East offices. First, I started by selecting all data from the `employees` data table. Then, I used a `WHERE` clause with `AND` to filter for employees who work in the Marketing department and in the East offices. I used `LIKE` with `East%` as the pattern to match because the data in the `office` column represents the East offices with the specific office number. The first condition is the `department = 'Marketing'` portion, which filters for employees in the Marketing department. The second condition is the `office LIKE 'East%'` portion, which filters for employees in the different East offices.

Retrieve employees in Finance or Sales

My team then had to perform a different security update on machines for employees in the sales and finance department. I have to get information on employees from these two departments.

The following code will show how I created a SQL query to filter employees in the finance or the sales department.

```
MariaDB [organization]> SELECT *
    -> FROM employees
    -> WHERE department = 'Finance' OR department = 'Sales' ;
+-------------+-------------+----------+------------+-------------+
| employee_id | device_id   | username | department | office      |
+-------------+-------------+----------+------------+-------------+
|        1003 | d394e816f943 | sgilmore | Finance    | South-153   |
|        1007 | h174i497j413 | wjaffrey | Finance    | North-406   |
|        1008 | i858j583k571 | abernard | Finance    | South-170   |
|        1009 | NULL        | lrodriqu | Sales      | South-134   |
|        1010 | k2421212m542 | jlansky  | Finance    | South-109   |
|        1011 | l748m120n401 | drosas   | Sales      | South-292   |
|        1015 | p611q262r945 | jsoto    | Finance    | North-271   |
|        1017 | r550s824t230 | jclark   | Finance    | North-188   |
|        1018 | s310t540u653 | abellmas | Finance    | North-403   |
|        1022 | w237x430y567 | arusso   | Finance    | West-465    |
|        1024 | y976z753a267 | iuduike  | Sales      | South-215   |
|        1025 | z381a365b233 | jhill    | Sales      | North-115   |
|        1029 | d336e475f676 | ivelasco | Finance    | East-156    |
|        1035 | j236k3031245 | bisles   | Sales      | South-171   |
|        1039 | n253o917p623 | cjackson | Sales      | East-378    |
|        1041 | p929q222r778 | cgriffin | Sales      | North-208   |
```

The first three commands in the screenshot are my query parameters, and the second part is a portion of the output I received. This query returns all employees in the Finance and Sales departments. First, I started by selecting all data from the `employees` data table. Then, I used a `WHERE` clause with `OR` to filter for employees who are in the Finance or Sales departments. I used the `OR` operator instead of `AND` because I want all employees who are in either department. If the `AND` operator is used it would return an error as it would be searching for employees who are set to both departments instead of pulling employees from both departments. The first condition is `department = 'Finance'`, which filters for employees from the Finance department. The second condition is `department = 'Sales'`, which filters for employees from the Sales department.

Retrieve all employees not in IT

My team and I are tasked with making one more update to employee machines. The employees in the Information Technology department already had this update so my team needed a list of employees for every department except the IT department.

The following code demonstrates how I created a SQL query filter a list of every employee outside of the IT department.

```
MariaDB [organization]> SELECT *
    -> FROM employees
    -> WHERE NOT department = 'Information Technology' ;
+-------------+--------------+----------+-----------------+-------------+
| employee_id | device_id    | username | department      | office      |
+-------------+--------------+----------+-----------------+-------------+
|        1000 | a320b137c219 | elarson  | Marketing       | East-170    |
|        1001 | b239c825d303 | bmoreno  | Marketing       | Central-276 |
|        1002 | c116d593e558 | tshah    | Human Resources | North-434   |
|        1003 | d394e816f943 | sgilmore | Finance         | South-153   |
|        1004 | e218f877g788 | eraab    | Human Resources | South-127   |
|        1005 | f551g340h864 | gesparza | Human Resources | South-366   |
|        1007 | h174i497j413 | wjaffrey | Finance         | North-406   |
|        1008 | i858j583k571 | abernard | Finance         | South-170   |
|        1009 | NULL         | lrodriqu | Sales           | South-134   |
|        1010 | k2421212m542 | jlansky  | Finance         | South-109   |
|        1011 | l748m120n401 | drosas   | Sales           | South-292   |
|        1015 | p611q262r945 | jsoto    | Finance         | North-271   |
|        1016 | q793r736s288 | sbaelish | Human Resources | North-229   |
|        1017 | r550s824t230 | jclark   | Finance         | North-188   |
|        1018 | s310t540u653 | abellmas | Finance         | North-403   |
```

The first three lines of commands in the screenshot are my query parameters, and the rest of the screen shot is a portion of the output I received. The query returns all employees not in the Information Technology department. First, I started by selecting all data from the `employees` data table. Then, I used a `WHERE` clause with `NOT` to filter for employees not in the Information Technology department.

Summary

I applied filters to different SQL queries to get specific information on login attempts and employee machines. I used two different tables, `log_in_attempts` and `employees`. I also used the `AND`, `OR`, and `NOT` operators to filter for the specific information that I needed to perform each task. I also used `LIKE` and the percentage sign (`%`) wildcard to filter for patterns.
